Java Question

Travel Agencies Question

Need to write getter setter for above attribute.
Need to create constructor
→ taking parameter as sequence is given.

Again Need to create Solution class

main method → in this class

In solution class, we have to implement two methods

findAgencyWithHighestPackagePrice & agencyDetailsForGivenId And Type

Input of this method is: → array of TravelAgencies object as an input parameter & return the highest package price from the given array of objects.

agencyDetailsForGivenIdAndType method

↓ → This will take three input parameters.

↓ 1st is array of TravelAgencies objects

↓ int regNo & String packageType as parameter

↪ And returns on some condition:

if the input parameters (regNo & packageType) should ~~matched~~ with the regNo & PackageType of TravelAgencies object.

And if condition not met return Null.

Program:-

→ class

```
public class TravelAgencies  
{
```

```
    int regNo;
```

```
    String agencyName;
```

```
    String packageType;
```

```
    int price;
```

```
    boolean flightFacility;
```

```
    // constructor with parameter
```

```
    public TravelAgencies(int regNo, st aN, st pT, int p, bF)  
    {
```

```
        this.regNo. = regNo.
```

```
        this.agencyName = aN.
```

```
        :  
        :  
        :  
    }
```

```
    }
```

```
    // Setter
```

```
    public void setRegNo(int regNo)  
    {
```

```
        this.regNo. = regNo.;
```

```
    }
```

→ same for other Attributes

```
    // Getters
```

```
    public int getRegNo()  
    {
```

```
        return this.regNo.;
```

→ same for other attributes.

// Now making class Solution which contains main method

```
public class Solution
```

```
{  
    public static void main(String[] args)
```

```
{  
    TravelAgencies[] tAgency =
```

```
{  
        new TravelAgencies(1, "A2Z Agency", "Platinum", 50000, true);
```

```
        new "    " (2, "SSS Agency", "Silver", 30000, true);  
        :  
    }
```

```
    int highestPackagePrice = findAgencyWithHightestPrice();
```

```
    System.out.println(highestPackagePrice);
```

```
    TravelAgencies details = agencyDetails.getType(tAgency, 2, "Silver")
```

```
    if (details != null)
```

```
    {  
        System.out.println("Agency Name: " + details.name + " price: " + details.price);  
    }  
    else
```

```
    {  
        System.out.println("NULL");  
    }  
}
```

```
public static int findAgencyWithHightestPackagePrice  
(TravelAgencies[] obj)
```

```
{  
    int x = 0;
```

```
// Returns Highest Package
```

```
for (TravelAgencies iterateTA: obj)
```

```
{  
    if (x < iterateTA.price)
```

```
        x = iterateTA.price;  
    }
```

```
return x;
```

Date:

Date:-

12 Dec
24

```

public static TravelAgencies agencyDetailsForGivenIDAndType
(TravelAgencies obj, int regNo, String packageType)
{

```

```

    TravelAgencies details = null;

```

```

    for(TravelAgencies iterateTA : obj)
    {

```

```

        if (iterateTA.flightFacility)
        {

```

```

            if (iterateTA.regNo == regNo)
            {

```

```

                for(TravelAgencies TA : obj)
                {

```

```

                    if (packageType == TA.packageType)
                    {
                        details = iterateTA;
                        break;
                    }
                }
            }
        }
    }

```

```

    return details;
}
